<p>ABSTRACT</p> <p>Now a days the world is moving towards the digital side. Many prefer to keep data in the digital format.</p> <p>what is digital data? digital data-data stored by computers in the form of 0s and 1s usually in HDD or SSD why digital data is preferred? -->portable -->easy to edit -->data cannot be lost easily -->read write of data is fast -->digital data can be duplicated easily -->they are quite secure in terms of privacy</p> <p>Schools,Colleges,Hospitals etc use digital data.This digital data is usually in the form of pdf's,excel sheets,video,audio etc. there is no single application which can run all of these formats of digital data.Usually two or more softwares are required. our idea is to create a software which can run almost any digital data format. We would be able to view and modify the digital data.The software would be able to convert from one format to another format as well.</p>
